

The Quantum Mind – Visual Summary

A Conceptual Framework by Bron R. Torres

Core Idea

The Quantum Mind proposes that human consciousness, identity, memory, and healing are better understood through a signal-based, coherence-driven framework rather than purely mechanistic or materialist models.

Key Principles

- * Coherence – Neural/energetic alignment like lasers
- * Resonance – Emotional entrainment
- * Superposition – Multiple identity states
- * Observer Effect – Attention shapes experience
- * Entanglement – Non-local relational influence
- * Decoherence – Trauma as collapsed signal pattern

Potential Applications & Questions

- Can trauma resolution be modeled as coherence restoration?
- Does therapeutic presence function like a quantum observer?
- Are deep meditative or psychedelic states periods of decoherence?
- Could AI, therapy, or education evolve through signal-based models of mind?

Purpose of the Document

This is not a theory of everything. It's a signal — a living lens — for refinement and collaborative evolution.
